Claro Argentina Uses the Intel vPro® Platform for Secure and Reliable Remote Device Management

Claro Argentina is a leading telecommunications company with operations throughout Latin America. Claro's Microinformatics (IT) team provides IT services for the company's 8,000 employees located throughout the country. Despite the team's technical expertise and responsiveness, unanticipated changes in such a large user base have the potential for an outsized negative impact on operations. The right technology, combined with the right partnerships, can make all the difference. When nearly all of Claro's employees shifted to remote work during the COVID-19 pandemic, the IT team needed a tool for remote management of thousands of devices that could be rolled out rapidly and at a large scale. Working with partner QS Technologies, Claro found a reliable solution that's more secure in Intel® Endpoint Management Assistant and Intel® Active Management Technology.
